

Basic Access Control

Basic Access Control Training

Theoretical and hands on introductory training for new entrants into the access control industry.

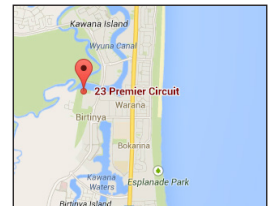

Access control systems, of some type, have always been employed in society. Today's systems usually consist of electronic locks, keypads, card readers, or biometric devices. Although these systems do much more than keep the wrong people out, that is still their basic function. Protecting people and property are the basic reasons for deploying an access control system, but improving productivity and limiting liability help business owners show a return on the required investment.:
